Mentor Check-In

Nov 13

Commit Document: `meeting-agenda`

Agenda

- Project Plan
    - How should we prioritize features?
    - Is our plan realistic?
- Tech Stack
    - To confirm, can we use React instead of Vue?
    - How can we implement authentication so that it's still relatively simple but closer to "industry standard?"
    - Would Heroku be too limiting? It's one of the more expensive PaaS options. Are there alternatives worth considering for deployment?

Achieved and Missed Milestones
- This past week we've written a project proposal, recorded a pitch, and wrote a team contract. We also gave feedback to other teams' pitches, as well as to each other.
- We are currently working on our full design plan and project plan, and we are on track to complete them by Monday.
- So far we have not missed any milestones.

Difficulties We Encountered
- We are trying to figure out our tech stack as well as how to implement good workflows.
- Prioritizing features -- for the prototype, MVP, and the finished product, respectively -- is proving to be a challenge.
- It is also a challenge figuring out how to craft the language we use to describe concepts in a way such that it is clear to us as developers as well as the end user.

Changes Made to Design/Project Plan
- We are currently working on making our full design plan and our project plan.
